

Are you ready?

Chapter 4 Transformation of Graphs aka Lots of Graphing!

Goals:

quadratic equations

graphs

IC 4.1.1 thru 4.1.2

HW 4-18 to 4-28 and 4-39 to 4-41

Give the three equations for a quadratic,
What do the parts of each equation do?

Standard Form:

Intercept Form:

Vertex Form:

Give the Quadratic Formula:

What does it find?

Give the equation for the line of symmetry:

What does it find?

What is the Discriminant?

What does it tell you?

Finding the coordinates of the vertex:

Find the coordinates of the vertex:

$$y = \frac{1}{2}x^2 - 6x - 14$$

$$y = -3(x - 4)^2 - 5$$

$$y = \frac{2}{17}(x + 2)(x - 4)$$

Std Form

Int. Form

Vertex Form

$f(x) = -x^2 - 6x - 8$		
		$f(x) = 2(x - 4)^2 - 2$
	$f(x) = \frac{1}{5}(x - 3)(x + 7)$	
		$f(x) = (x - 1)^2 - 4$

What are the important points of a parabola?

Graph the parabola $y = x^2$. Plot points.

Use a whole sheet of graph paper.

When you are sure that your graph is complete and accurate, trace over it in colored pencil. This is the **parent graph**.

Use a graph like this

Find a way to change the equation to make the **parent graph** *stretch vertically*. The new parabola should have the same vertex and orientation.

Find a way to change the equation to make the **parent graph** *compress vertically*. The points will seem to rise away from the vertex less quickly.

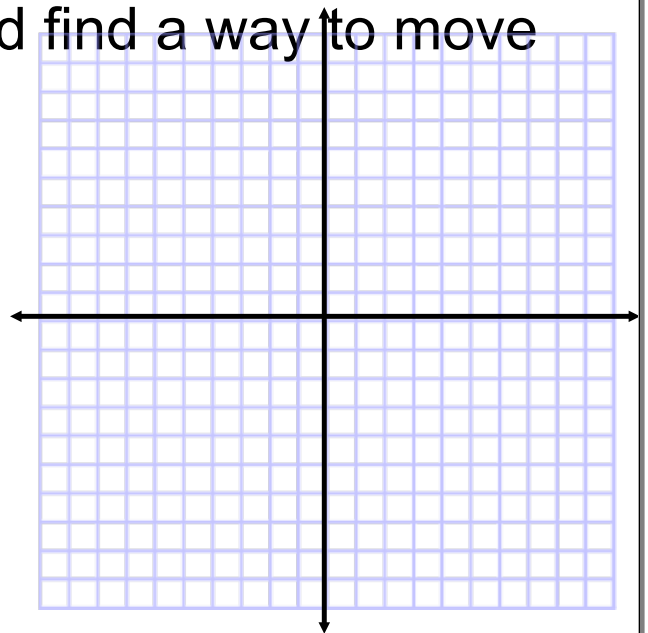

Find a way to change the equation to make the **parent graph** *open downward*. The new parabola should be a reflection over the x-axis of the **parent graph**.

Find a way to change the equation to make the **parent graph** *move 5 units down*. Your new parabola should look the same but the vertex will be at $(0, -5)$. Also, from this, you should find a way to move the graph up.

Find a way to change the equation to make the **parent graph** *move 3 units to the right*. Your new parabola should be the same as the **parent graph**, except the vertex should be at $(3, 0)$. Also, from this, you should find a way to move the graph to the left.

let's see how you do...

Find a way to change the equation to make the **parent graph** *move 3 units to the left* and *stretch vertically*.

Make the **parent graph** *vertically compressed, open down, move 6 units up and move 2 units left.*

What is the new equation?

Where is the new vertex?

For each of these give the coordinates of the vertex, the x-intercepts and y-intercept and say whether it opens up or down.

	Vertex	x-ints	y-ints	up/down
$y = (x + 9)^2$				
$y = x^2 + 7$				
$y = 3x^2$				
$y = -(x - 7)^2 + 6$				
$y = \frac{1}{3}(x - 1)^2$				
$y = 2(x + 3)^2 - 8$				

HW 4-18 to 4-28 and 4-39 to 4-41
